

Homework: ERC-721

In this assignment, you will create an ERC721 token contract that allows users to create and trade unique, non-fungible tokens. Follow the guidelines for the ERC721 token standard to ensure that your contract is compatible with other applications and wallets that support ERC721 tokens.

Functionality

Your implementation should follow all requirements described in the Specification section of the ERC-721 standard. [Link here](#).

If you find any parts of the ERC721 token contract too difficult to implement, you can reference the [OpenZeppelin implementation](#) of the ERC721 token standard. Please note that copying code without understanding it is not recommended, but it can be a useful resource for learning and understanding best practices for ERC721 token contracts.
